

The purpose of this notebook is to verify that a certain pair of circuits have (almost) the same effect on the input state $|000..0\rangle$.

These two lines immediately below only need to be executed once, after Mathematica launch

Download the QuEST Mathematica package, and
Connect to the remote Igor server or Local

```
In[132]:= Import["https://quest.qtechtheory.org/QuEST.m"];  
CreateDownloadedQuESTEnv[];
```

Build the circuit found in the main part of the paper (258 gates, 204 with general parameters)

```

In[134]:= circuitA = {Rz0[α1], Rz1[α3], Rz2[α5], Rz3[α7], Rz4[α9], Rz5[α11], Ry0[α2], Ry1[α4],

```

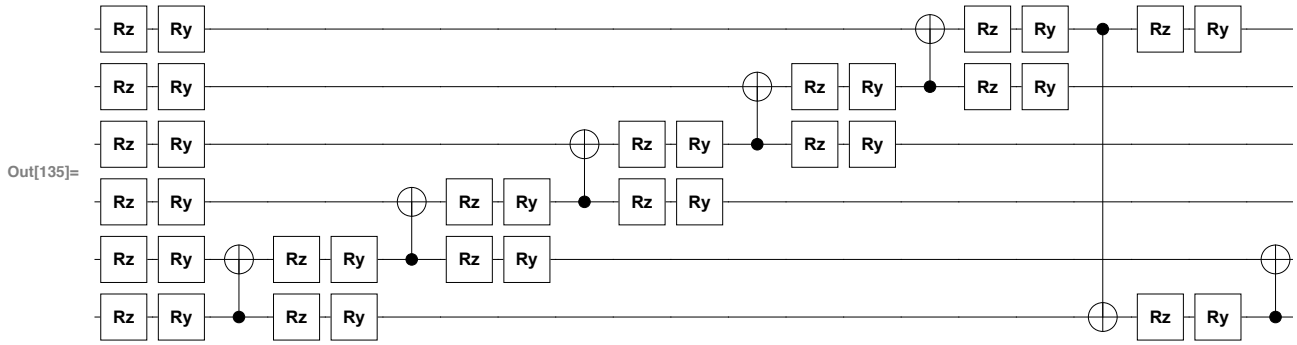

```
DrawCircuit[circuitA /. αq_ → α]
```

```
(* note: the replacement rule αq_ →
```

```
α strips all the indices from the parameters;
```

```
otherwise DrawCircuit will think they refer to qubits
```

```
and conclude there are 205 qubits in the circuit! *)
```

```

Now, create two 6-qubit pure state registers, and apply the circuits using them.
(The CreateQureg commands only need to be run once per session, to create the objects)

```

In[140]:=  $\psi$  = CreateQureg @ 6;
 $\phi$  = CreateQureg @ 6;

```

In[142]:=

```
InitZeroState @  $\psi$ ;
ApplyCircuit[circuitA /. paramsA,  $\psi$ ,  $\phi$ ];
(* apply A to input state  $\psi=|00..0\rangle$  putting result in  $\phi$  *)
ApplyCircuit[circuitB /. paramsB,  $\psi$ ];
(* apply B to input state  $\psi=|00..0\rangle$  putting result back in  $\psi$  *)

Print[
  "The fidelity of the state 'circuitA.|00..0>' versus 'circuitB.|00..0>' is ",
  CalcFidelity[ $\psi$ ,  $\phi$ ], "."]
```

The fidelity of the state 'circuitA.|00..0>' versus 'circuitB.|00..0>' is 0.999924.
